

Safe Working Platform service inside your conical process vessel

Safety regulations getting stronger and the installation of a working platform mostly takes a lot of time and man-power.

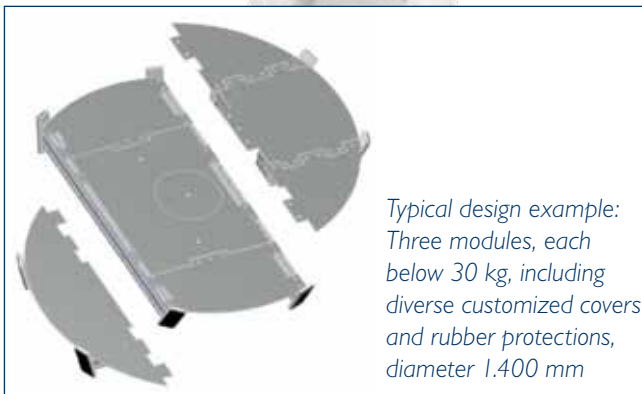

Urgent repair works can't start as the carpenter company is delayed. Wooden constructions or platforms out of carbon steel pipes are often not allowed or too intricately to install. **Are you looking for a safe and also for a fast and smooth installable working platform, which can be used for many years?**

We are pleased to offer you our modular and individual designable working platform for a fast installation.

Our working platforms can be installed inside almost all conical process vessels like reactors, orbital arm and single shaft dryers and mixers.

The essential features of the working platform are:

- Checked by German TÜV and CE-compliant
- Stable aluminium construction
- Fast and easy installation
- Modular design allowing the installation via man-way or other vessel nozzles
- Low weight - each module below 30 kg
- Easy handling - only a few bolts have to be fixed for a safe installation of the platform
- Rubber pads to protect the vessel's wall surface
- Rescue hatches or any other requested openings are possible
- Additional features like ladders are available

*Typical design example:
 Three modules, each
 below 30 kg, including
 diverse customized covers
 and rubber protections,
 diameter 1.400 mm*
